(1) See document "Voltage Proof Test for Metalized Capacitors" (www.vishay.com/doc?28169)

(2) Statements about life time are based on calculations which are based on internal tests. They have to be understood exclusively as estimations. Also due to external factors, the life time in the field application may deviate from the calculated life time. See APPLICATION NOTES AND LIMITING CONDITIONS on page 12 for intended continuous mains voltage.

CONSTRUCTION

Low inductive wound cell elements of metallized polypropylene film, potted with resin in a flame retardant case.

SPECIFIC METHOD OF MOUNTING TO WITHSTAND VIBRATION AND SHOCK

The capacitor unit is designed for mounting on a printed circuit board.

In order to withstand vibration and shock tests, it must be insured that the stand-off pips are in good contact with the printed circuit board.

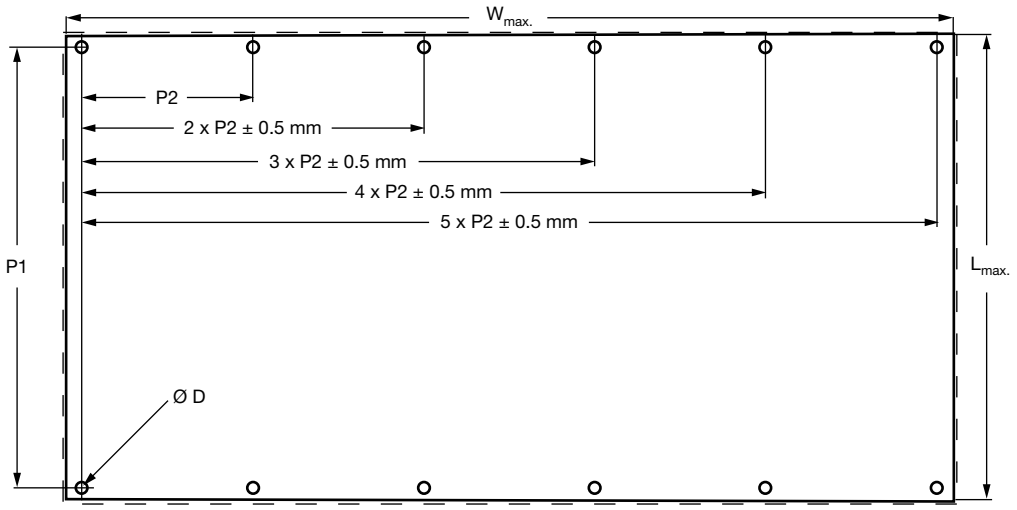
The capacitors shall be mechanically fixed by the leads and the body clamped.

SPACE REQUIREMENTS ON PRINTED-CIRCUIT BOARD AND DIMENSIONS TOLERANCES

For the maximum product dimensions and maximum space requirements for length ($l_{max.}$), width ($w_{max.}$) following tolerances must be taken in account in the envelopment of the components as shown in the drawings below:

$L_{max.} = l + \Delta l$

$W_{max.} = w + \Delta w$



P1 (mm)	$L_{max.}$ (mm)	$W_{max.}$ (mm)	Ø D (mm)	Δh (mm)
27.5	l + 2	w + 1.6	1.2	0.2
37.5	l + 3	w + 2.0	1.5	0.5
52.5	l + 4	w + 2.4	1.7	0.5

For the maximum height $h_{max.}$, a Δh of 0.5 mm must be taken in account on the height dimension h.

For the minimum product dimensions for length ($l_{min.}$), width ($w_{min.}$), and height ($h_{min.}$) following tolerances of the components are valid:

$l_{min.} = l - \Delta l$, $w_{min.} = w - \Delta w$ and $h_{min.} = h - \Delta h$

For products with pitch = 27.5 mm, Δl = 1.5 mm, and Δw = Δh = 0.5 mm

For products with pitch = 37.5 mm, Δl = 1.5 mm, and Δw = Δh = 1.0 mm

For products with pitch = 52.5 mm, Δl = 1.5 mm, and Δw = Δh = 1.0 mm

SOLDERING CONDITIONS

For general soldering conditions and wave soldering profile we refer to the document “Characteristics and Definitions Used for Film Capacitors”: www.vishay.com/doc?26033.

STORAGE TEMPERATURE

T_{stg} = -23 °C to +35 °C with relative humidity of maximum 75 % without condensation

RATINGS AND CHARACTERISTICS REFERENCE CONDITIONS

Unless otherwise specified, all electrical values apply to an ambient temperature of 23 °C ± 1 °C, an atmospheric pressure of 86 kPa to 106 kPa and a relative humidity of 50 % ± 2 %.

For reference testing, a conditioning period shall be applied over 96 h ± 4 h by heating the products in a circulating air oven at the rated temperature and a relative humidity of 50 % ± 2 %.

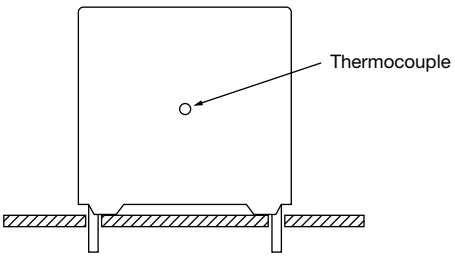
POWER DISSIPATION AND MAXIMUM COMPONENT TEMPERATURE RISE

The power dissipation must be limited in order not to exceed the maximum allowed component temperature rise as a function of the free air ambient temperature.

The component temperature rise (ΔT) can be measured or calculated by $\Delta T = P/G$:

- ΔT = component temperature rise (°C) with a maximum of 15 °C
- P = power dissipation of the component (mW)
- G = heat conductivity of the component (mW/°C)

MEASURING THE COMPONENT TEMPERATURE



The case temperature is measured in unloaded (T_{amb}) and loaded condition (T_C).
The temperature rise is given by $\Delta T = T_C - T_{amb}$.
To avoid thermal radiation or convection, the capacitor must be tested in a closed area from air circulation.

APPLICATION NOTES AND LIMITING CONDITIONS

- These capacitors are not suitable for mains applications as across-the-line capacitors without additional protection
- These mains applications are strictly regulated in safety standards and therefore electromagnetic interference suppression capacitors conforming the standards must be used
- To ensure withstanding high humidity requirements in the application the epoxy adhesion at the leads shall not be damaged. Therefore the leads may not be damaged or not be bent before soldering
- To choose a component family please refer to Vishay application note: www.vishay.com/doc?28245 and note additionally following conditions:
  - The peak voltage (U_{p+}) shall not be greater than $\sqrt{2} \times U_{RMS}$
  - The peak-to-peak ripple voltage (U_{pp}) shall not be greater than $2 \times \sqrt{2} \times U_{RMS}$
  - The voltage pulse slope (dU/dt) shall not exceed the rated pulse slope at the DC voltage rating

  If the pulse voltage is lower than the rated DC voltage, the rated voltage pulse slope may be multiplied by U_{NDC} and divided by the applied voltage.

$$2 \times \int_0^T \left(\frac{dU}{dt}\right)^2 \times dt < U_{NDC} \times \left(\frac{dU}{dt}\right)_{rated}$$

  T is the pulse duration
- The maximum component surface temperature must be lower than 105 °C and maximum temperature rise between case and free air ambient shall be lower than 15 °C
- For continuous operation, 24 hours per day for several years, please refer to application note: www.vishay.com/doc?28245
